## Dupline ${ }^{\circledR}$ Profibus-DP Gateway Type G 38910020

## Product Description

Dupline ${ }^{\circledR}$ Channel Generator with the function of a PRO-FIBUS-DP slave. This means that the 128 Dupline ${ }^{\circledR}$ I/O's (incl. AnaLink) can be read/ controlled by PROFIBUS-DP masters (PLC's, PC interface cards, etc. from various suppliers). Several Dupline ${ }^{\circledR}$ gateways can be connected
to the same PROFIBUS-DP network. The unit is certified by PNO (Profibus Nutzer Organisation) which ensures compatibility and interoperability with other PNO-certified products.

## Input/Output Specifications

## General Specifications

| Power ON delay | $<2.5 \mathrm{~s}$ until start of <br> Dupline carrier. <br> $<40 \mathrm{~s}$ until correct reading <br> of AnaLink values |
| :--- | :--- |
| Environment <br> Degree of protection <br> Pollution degree <br> Operating temperature <br> Storage temperature | IP 20 <br> 3 (IEC 60664$)$ <br> $0^{\circ}$ to $+50^{\circ} \mathrm{C}\left(+32^{\circ}\right.$ to $\left.+122^{\circ} \mathrm{F}\right)$ <br> $-20^{\circ}$ to $+85^{\circ} \mathrm{C}\left(-4^{\circ}\right.$ to $\left.+185^{\circ} \mathrm{F}\right)$ |
| Humidity (non-condensing) | 20 to $80 \% \mathrm{RH}$ |
| Mechanical resistance | $15 \mathrm{G} \mathrm{(11} \mathrm{ms)}$ |
| Shock <br> Vibration | $2 \mathrm{G}(6$ to 55 Hz$)$ |
| Terminals | Screwterminals |
| Tightening torque | 0.8 Nm |
| Dimensions | H 8 -housing |
| Weight | 540 g |

|  |  |

## Supply Specifications

| Power supply | Overvoltage cat. III (IEC 60664) |
| :---: | :---: |
| Rated operational voltage |  |
| through term. 21, 22, 23 \& 24 | See wiring diagram <br> 230 VAC $+15 \%$ (IEC 60038) |
| 115 | $115 \mathrm{VAC} \pm 15 \% \text { (IEC 60038) }$ |
| Frequency | 45 to 65 Hz |
| Rated operational power | 11 VA |
| Rated impulse withstand |  |
| voltage 230 | 4 kV |
| 115 | 2.5 kV |
| Dielectric voltage |  |
| Supply - Dupline ${ }^{\circledR}$ | $\geq 4 \mathrm{kVAC}$ (rms) |
| Supply - RS 485 | $\geq 4 \mathrm{kVAC}$ (rms) |

## Wiring Diagrams

## Mode of Operation

The Dupline ${ }^{\circledR}$ PROFIBUS-DP Gateway is a Dupline channel generator with the function of a PROFIBUS-DP slave according to EN 50 170. This means that the 128 Dupline ${ }^{\circledR}$ I/O's (incl. AnaLink) can be read/ controlled by PROFI-BUS-DP masters like PLC's and PC interface-cards from many different suppliers. Several Dupline ${ }^{\circledR}$ gateways can be connected to the same PROFIBUS-DP network and operate together with other PROFIBUS-DP modules like operatorpanels, MMI's, frequency inverters, I/O-modules etc.

The Dupline ${ }^{\circledR}$ PROFIBUS-DP Gateway is approved by
the PNO (Profibus Nutzer Organisation) that ensures compatibility with other PNO-certified products.

## Configuration Switches

The unit is equipped with the following configuration switches (see also Switch settings):

1 x 16-position rotaryswitch for selecting the Number of Dupline ${ }^{\oplus}$ channels in the range $8 . .128$ (in steps of 8). The selected letter indicates the last channel group available on Dupline®. If e.g. H is selected, the 64 channels in groups A..H will be available.
$2 \times 10$-position rotary switch for selection of the PROFI-BUS-DP Slave Address in the range 02..99. (00.. 01 are reserved). Each module connected to PROFIBUS-DP must have a unique slave address which enables the PROFI-BUS-DP Master to access the modules individually.
$1 \times$ DIP-switch for selection of Dupline ${ }^{\circledR}$ Operation Mode. In "Normal" mode, Dupline ${ }^{\circledR}$ operates as a peer-to-peer system where the channel generator automatically establishes a connection between Dupline ${ }^{\oplus}$-inputs and Dupline ${ }^{\oplus}$-outputs which are coded to the same Dupline ${ }^{\circledR}$-address. If e.g. an input
coded for B5 is activated, the output(s) coded for B5 will also be activated.

Consequently, a Dupline ${ }^{\circledR}$-output can either be activated through the output-data received on PROFIBUS-DP or by an active Dupline ${ }^{\circledR}$ input coded for the same Dupline ${ }^{\circledR}$-address.
In "Split I/O" mode, the Dup-line-inputs and Dupline ${ }^{\circledR}$-outputs are treated independently by the channel generator. If e.g. an input coded for B5 is activated, the Gateway will make the information available on PROFIBUS-DP (like in normal mode), but it will not automatically activate the Dupline ${ }^{\circledR}$-output(s) coded to

## Mode of Operation (cont.)

B5. The Dupline ${ }^{\circledast}$-outputs are controlled exclusively through the output data received on PROFIBUS-DP.
In this mode, up to 128 Dupline ${ }^{\circledR}$ inputs and 128 Dupline outputs are available, since an input and an output coded to the same Dupline ${ }^{\oplus}$-address can operate independently.
$1 \times$ DIP-switch for selection
of Analog Protocol to either AnaLink (8-bit format) or multiplex ( 16 -bit format). The Gateway will only transfer analog values from modules using the selected protocol. If multiplex is selected, the Gateway will automatically perform the required multiplexing on channels A1-A4. Because of this, these 4
channels are not available as outputs when the multiplex protocol is selected.

## $1 \times$ DIP-switch for version selection

Normally, the version selection is supposed to be in the OFF position, especially when the Gateway is used in new installations and configured with the G38_20.GSD file.
In replacements or expansion of existing installations, this switch may be switched on, in order to make set the Gateway to operate towards the previous GSD version. (Mod-6590.GSD)

## Dupline ${ }^{\circledR}$ Input Data

To ease up the Profibus Master configuration, the

G38 020.gsd file is to be used. This file describes to the Master which I/O data the gateway supports.
All I/O data are selectable through so-called modules; each described with its particular function.
Digital Input, Digital output, Analog input etc. Through this, the individual configuration of the Gateway is quite simplified, as the user only has to select which I/O modules to use. The supported modules may be selected in any order and any combination.

The G38910020 gateway supports one Digital input module, and One Digital output module, corresponding to the 128 channels of input
and output data. Furthermore, when Multiplexed analog data are selected on the Dupline, up to 112 Analog values may be read, and this is done through additional 14 Input modules named "Aln". (Mux:CD,0-7/Alink:AB)" , "Aln (Mux:CD,8-F/Alink:CD)"...
"Aln (Mux:OP,8-F)".
All modules consist of 16 bytes of data, and the tables below describe the content and the relations to the Dupline data.

If the Dupline ${ }^{\circledR}$ signal is short-circuited, the gateway will set the input status of all channels to OFF, and issue a diagnostics information to the Profibus master.

Byte 0.. OF $_{\mathrm{h}}$ Digital input module

| Byte adress | Dupline Group | Bit | Channel Number |
| :---: | :---: | :---: | :---: |
| 0 | A | 7 | A1 |
| 0 | A | 6 | A2 |
| 0 | A | 5 | A3 |
| 0 | - | - | - |
| 0 | A | 0 | A8 |
| 1 | B | 7 | B1 |
| 2 | C | 6 | C2 |
| - | - | - | - |
| E | O | 1 | O7 |
| F | P | 0 | P8 |

Byte 0.. OF ${ }_{\text {h }}$ Digital output module

| Byte adress | Dupline Group | Bit | Channel Number |
| :---: | :---: | :---: | :---: |
| 0 | A | 7 | A1 |
| 0 | A | 6 | A2 |
| 0 | A | 5 | A3 |
| 0 | - | - | - |
| 0 | A | 0 | A8 |
| 1 | B | 7 | B1 |
| 2 | C | 6 | C2 |
| - | - | - | - |
| E | O | 1 | O7 |
| F | P | 0 | P8 |

Byte 0.. OF h Analog input module, multiplexed

| Byte adress | Dupline Groups | Multiplex address |
| :---: | :---: | :---: |
| 0,1 (Hi,Lo) | A | 0 |
| 2,3 | A | 1 |
| 4,5 | A | 2 |
| 6,7 | - | - |
| $\mathrm{A}, \mathrm{B}$ | A | - |
| $\mathrm{C}, \mathrm{D}$ | B | 6 |
| $\mathrm{E}, \mathrm{F}$ | C | 7 |

The multiples analog values are represented as 16 -bit "sign and magnitude" (2 Bytes: Hi,Lo)
The most significant bit defines the sign ( $0:+, 1:-$ ) while the
remaining 15 bits define the magnitude ( $0 . .32768$ ).

Byte 0.. OF h Analog input module, AnaLink selected

| Byte adress | Dupline Groups |
| :---: | :---: |
| 0 | A1 |
| 1 | A2 |
| 3 | A3 |
| - | - |
| - | - |
| E | B7 |
| F | C8 |

The AnaLink analog values are represented as 8 bit binary value ranging from 0 to 255 .

## Switch Settings

## Pin Assignment

| Pin | Signal |
| :--- | :--- |
| 3 | B |
| 4 | RTS |
| 5 | GND |
| 6 | +5 V |
| 8 | A |

## Dimensions (mm)
